

## Black holes, white holes & Wormholes

Black holes have never been observed on what might happen to the matter when it is sucked in.

The theory of wormholes being able to travel great distances in space is through a tunnel.

This tunnel being a wormhole, the wormhole is said to be on the inside of a black hole.

Another theory is the white hole which is the opposite to a black hole. The white hole is theorized to be the entrance to the other part of space where the black hole is the exit.
